Code

C# | Auto

```csharp
public class Solution {
    public IList<IList<string>> GroupAnagrams(string[] strs) {
        Dictionary<string, List<string>> signatureDict = new Dictionary<string, List<string>>();
        int[] counts = new int[26];
        /*
        here im using the same concept from the first problem
        but since I have to compare it to alot of words,  I thought of something else
        since for a word to be an anagram, it would have to have the same 1s in the map array, then I can just use these
        1s to compare  3la tool
        if signature exists, just add it to the list connected to that signature in the dict
        if it doesn't, make a new list, adding that  word to that list, and then adding that list + sig to the dict
        then in the end run through dict, add the lists in it which would be full of the anagrams, into a big list to
        return
        */
        foreach(string str in strs)
        {
            foreach(char c in str)
            {
                counts[c-'a']++;
            } //making the sig
                string sig = string.Join(",", counts); //turning it into a 1sand0s string
                if(signatureDict.ContainsKey(sig))//if it exists add it to the list
                {
                    signatureDict[sig].Add(str);
                }
            else
            { //sig doesnt exist -> make new list, add it to the dict along with the new sig
                List<string> listOfAnagrams = new List<string>();
                listOfAnagrams.Add(str);
                signatureDict[sig]=listOfAnagrams;
            }
            counts = new int[26]; //reset count
        }
        List<IList<string>> resList = new List<IList<string>>();
        foreach(var list in signatureDict.Values) resList.Add(list);
        return resList;
    }
}
